

17 MILLION WOMEN HAVE SUDDEN URINE LOSS

It is not normal to lose urine with laugh, cough, sneeze or with aging. NOW there is a new minimally invasive outpatient procedure that can be done with local anesthesia to correct these problems. The recovery period following the procedure is short, and patients experience few complications and minimal scarring after surgery.

You can go back to your routine in just a day or two.

It's also clinically proven: 96% of women who participated in a five year study are still dry, or experience significantly less leakage.

don't make me

laugh!
laugh!

Now there is a safe, effective treatment for urinary leakage.

- No overnight hospital stay
- Fast recover time
- Proven technology

Don't wait!

Call for an appointment now.
It's good to be able to laugh!
